

# Mac OSX Working with FastFilms on Intel-based Macs (Mac only)

**Problem:** If your FastFilms license files will not load into Photoshop CS3.

**Solution:** Run both Photoshop and FastFilms in emulation under Rosetta.

1. Open your Photoshop folder and select the application.

2. Hold down the apple key and hit the letter “I” to pull up the Info box.

3. Put a check in the Open using Rosetta box

Intel-based Macs give users the option to run applications such as Photoshop either natively on the Intel platform, or under emulation on Power PC (via Rosetta). However, you must choose to run the entire application (including plug-ins) entirely natively or entirely under emulation. Therefore, if you are using FastFilms with Photoshop CS3, you must run both Photoshop and FastFilms in emulation under Rosetta. If you choose to run under Rosetta you may see a very slight performance drop.
